Trans. of Mikrokchim[ica] Acta (Austria) 1960, no. 2,
p. 245-253.

The generation of nitrogen, as in the case of an easily
deaminable amine, took place rapidly and completely
at as low as 20°C. With the pyrroline compounds, a
further gas-producing reaction at 50°C and above was
determined, which at 80°C yields 1.40 moles
(N₂ + N₂O). In the first reaction an N-nitroso com-
pound is formed, which is unstable in an aqueous solu-
tion. During its hydrolysis, a diazonium salt is pro-

11 refs.

Order from SLA ml\$1.80, ph\$1.80 61-10314

Trans. of Mikrokhim[ica] Acta (Austria) 1960 [no. 1]
p. 62-71.

A hydroxyl compound, and probably the corresponding
nitrolic acid, is formed during the deamination. In
the case of alpha-amino acids, carbon dioxide is also
liberated. The extent of the formation of nitrolic acid
depends on the concentration of the nitrite solution;
under conditions for the determination of the amino
nitrogen, about 30% is produced. The nitrolic acid is
the starting point for the anomalous production of gas.
When the temperature is increased, the isonitroso

MICRO DETERMINATION OF GLYCOL ETHER
COMPOUNDS. [1960] 7p. (2 figs. 1 diag. omitted)
7 refs.

Order from SLA mi\$1.80, ph\$1.80 61-10311

Trans. of Mikrokchim[ica] Acta (Austria) [1960] no. 2,
p. 254-260.

The method is based upon glycol ethers yielding one mole of (ethyl iodide ethylene) with boiling hydriodic acid. The resultant ethyl iodide and ethylene are swept by carbon dioxide into a receiver charged with a standard silver nitrate solution (in glacial acetic acid), where ethyl iodide becomes absorbed. The ethylene is carried by the carrier gas into the azotometer where, after absorption of the carbon dioxide, ethylene is left behind. The ethyl iodide is determined by back-titrating the receiving silver nitrate solution with potassium iodide, using iodine and starch as an (Chemistry--Analytical, TT, b. 5, no. 4) (over)

Using our own bases of calculation and the ones intro-
duced by Stranski, also applying a simplified calculation
scheme according to Becker and Döring, the linear rate
of the growth of crystals is determined for flawless
crystals. At a small supersaturation already the forma-
tion of each two dimensional nucleus leads to the addition
of a new layer of atoms upon the crystal surface.
